VACCINE RECOMMENDATIONS & CHILDHOOD HEALTH

U.S. historical comparisons | 2000-2022 | Pearson correlation (r)

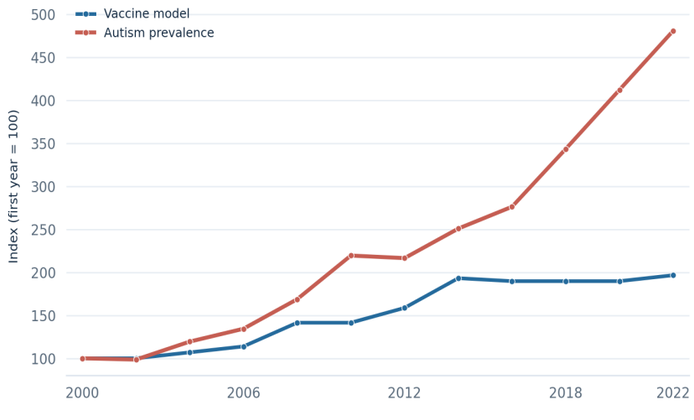

ONE-PAGE REFERENCE

28 OCT 2026

AUTISM

+0.885

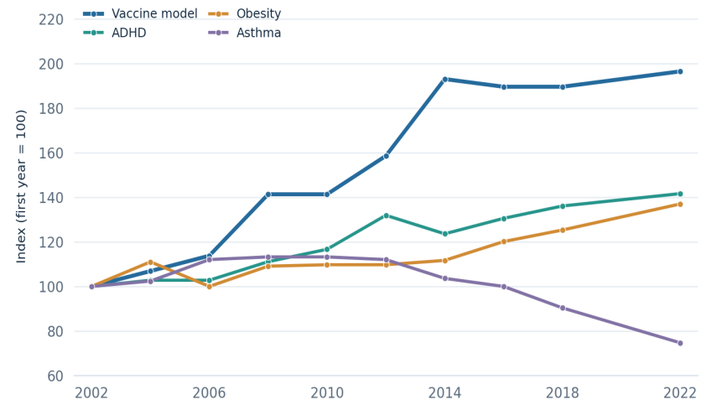

12 surveillance years | birth-cohort model

CHRONIC CONDITIONS

+0.935 / +0.827 / -0.563

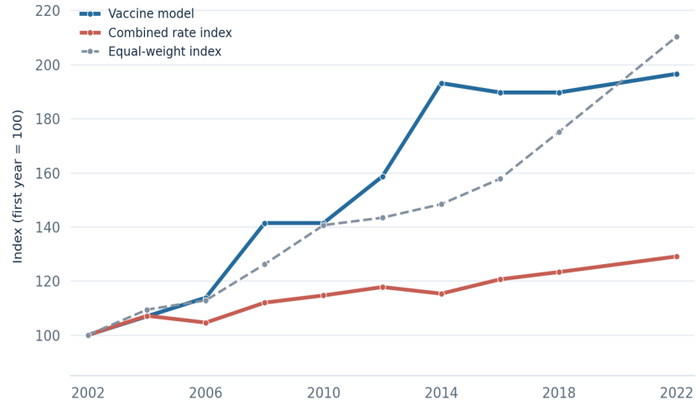

ADHD Obesity Asthma

COMBINED AFFLICTIONS

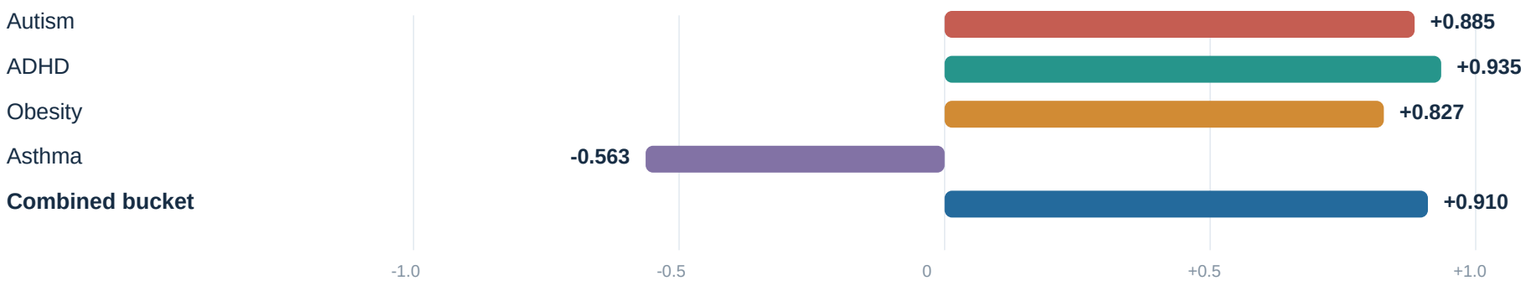

+0.910

10 matched years | birth-cohort model

CORRELATION SNAPSHOT

Modeled birth-cohort vaccine recommendations vs. each health series

ALTERNATE COMPARISONS

Autism dose-model variants:

Fixed +0.866 | +flu +0.870 | +maternal +0.885

COVID at age 7-8: +2 doses +0.911 | +3 +0.920

Same-year: Autism +0.591 | Combined +0.646

Period changes: Autism -0.190 | Combined -0.221

Equal-weight combined index: +0.888

WHAT IS THE COMBINED BUCKET?

Autism (%) + ADHD (%) + current asthma (%) + obesity (%). It sums reported rates; it is NOT a % of unique children.

Vaccine exposure is reconstructed from historical recommendations (including modeled maternal doses), NOT individual vaccination records.

Different age groups and changing survey definitions limit comparisons. Historical correlation does not establish causation.

DATA: CDC autism surveillance, NHIS, NHANES; vaccine schedules reconstructed earlier in this conversation. The r values are exploratory.
